makrolon®

Cool, Bright, High or Sky –
an Atmospheric Feeling.

Colour-true Light Transmission

All products in the Makrolon® DX range are radiant through their high colour fastness. Thanks to the synthesis of our special ultra-transparent polycarbonate raw material with diffusion additives, the light colour created remains constantly radiant even on emission. The ideal lighting solution for adjustable cool/warm white and RGB-coloured LEDs.

**Light Comfort and Safety –
with Makrolon® DX Diffuser Sheets**

Makrolon® DX Cool

Makrolon® DX Cool

The Makrolon® DX Range

Makrolon® DX Cool – white & translucent

DX Cool is an impressive bright, white, translucent solid sheet with a cool and fresh colour impression – even for switched-off LEDs. DX is one of the first diffuser sheets in the LED coverage field and has already delighted many users. DX Cool is the white diffuser sheet with the highest hiding power and has one matte and one bright surface.

Makrolon® DX Bright – opal white & widely diffused

DX Bright is an opal white, translucent solid sheet with a matte and bright surface. Added scattering pigments create a balance between light diffusion and penetrability which is 74% for this type. DX Bright boasts the best balance between light transmission and hotspot lamination.

Makrolon® DX High – opal white & for highlights

DX High is another opal white, translucent solid sheet with a matte and bright surface. Special diffusion material ensures lower light diffusion than in the DX Bright. Yet it also boasts more targeted lighting and increased translucence of 84%. DX High is the most efficient of our white diffuser sheets with respect to light transmission with sufficient coverage.

Makrolon® DX Sky* – transparent & bright

DX Sky is a colourless, translucent solid sheet with a micro-structure applied to one side. It combines maximum brightness with light management by LED-based lights and has a uniform light-emitting surface with excellent anti-glare properties.
